E-Commerce Landing Page — Part 2

Responsive & Interactive — Lab Worksheet

Name: _____ Section: _____ Date: _____

How to use this sheet: This lab is pure application — no new CSS syntax today. You'll take the hover states and media queries from the last two theory classes and use them to finish your Kiln & Co. landing page: a mobile layout, a responsive navbar, responsive cards, and hover feedback on buttons and cards.

Part 1 — Quick Recall

No TRY THIS steps here — just write these from memory before you open your files.

Q1. Without checking your notes, write the CSS selector for making a button change color when hovered (just the selector and property, not a full file).

Q2. Write the media query syntax for applying styles only when the screen is 600px or narrower.

Part 2 — Main Task: Make It Responsive & Interactive

Open the `ecommerce-landing.html` and `style.css` you built in the last lab. You're adding to that same file today — this is the project, not a new build.

Reference Design — Mobile — target layout at phone width (~390px): secondary nav links hidden, cart button kept, hero shrunk, cards stacked in a single column.

MAIN TASK · MAKE IT RESPONSIVE & INTERACTIVE

Step 1 — Hover: Hero Button

On your hero's call-to-action button/link, add a `:hover` rule that changes its `background-color` to a slightly darker or lighter shade. Add `cursor: pointer;` too.

Step 2 — Hover: Add to Cart Buttons

Do the same for your "Add to Cart" buttons on each product card — a `:hover` rule that changes `background-color` and/or `color`.

Step 3 — Hover: Product Cards

Add a `.card:hover` rule that changes the card's border color to something more noticeable, plus `cursor: pointer;` — so hovering anywhere on a card gives feedback, not just the button.

Step 4 — Mobile Breakpoint: Stack the Product Cards

Add `@media (max-width: 700px) { ... }`. Inside it, change your `.products` rule so `flex-direction: column;` and `align-items: center;`. Give `.card` a `width: 90%;` inside the same media query so each card fills most of the narrow screen instead of staying a fixed pixel width.

Step 5 — Responsive Navbar

Inside a media query (reuse the same breakpoint or pick a new one), hide your less essential nav links with `display: none;`, keeping just the logo and the cart link visible — look at the reference image for which links stay.

Step 6 — Shrink the Hero for Mobile

In the same media query, reduce your hero heading's `font-size` and the hero's `height` so the text doesn't overflow or leave awkward empty space on a narrow screen.

Step 7 — Test Across Breakpoints

Use DevTools' device toolbar to check your page at a phone width (~375–390px) and a tablet width (~768px). Confirm the navbar, hero, and cards all adapt correctly at each, not just at one exact width.

Q3. Which media query breakpoint(s) did you use, and why did you pick those widths?

Q4. Which elements did you add `:hover` effects to, and what visual feedback does each one give the user?

Q5. Compare your mobile layout to your desktop layout — list at least three things that changed.

Q6. Test at a real narrow width in DevTools (or your own phone). Does anything look broken or surprising that you didn't expect?
